openframeworks – Code::Blocks setup guide:

here at eyebeam, we've been experimenting with using codeblocks as an alternative to devcpp. big props to friedrich for getting us going. it's based on the same compiler (mingw) but as an IDE has some obvious benifits:

- a) active community
- b) significantly less buggy
- c) just had a new release

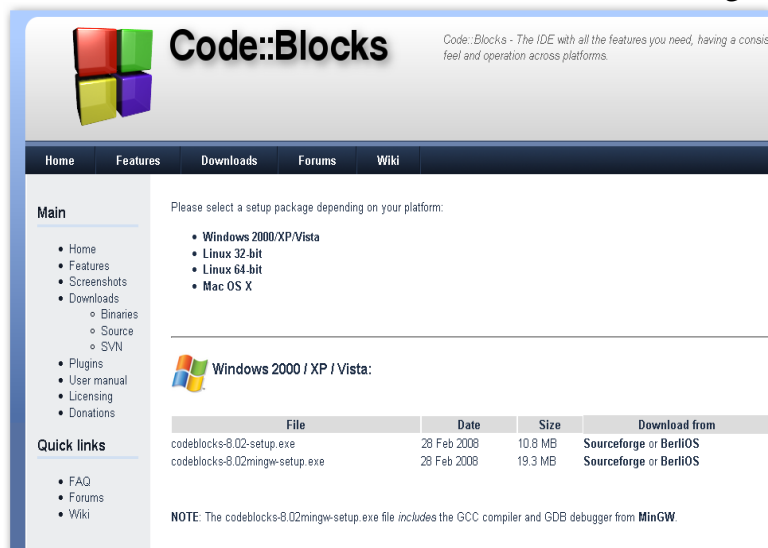

we will release 0.05 w/ codeblocks as opposed to devcpp, since devcpp has serious limitations

here's a step by step tutorial to get up and running, and inport your devcpp projects in codeblocks.

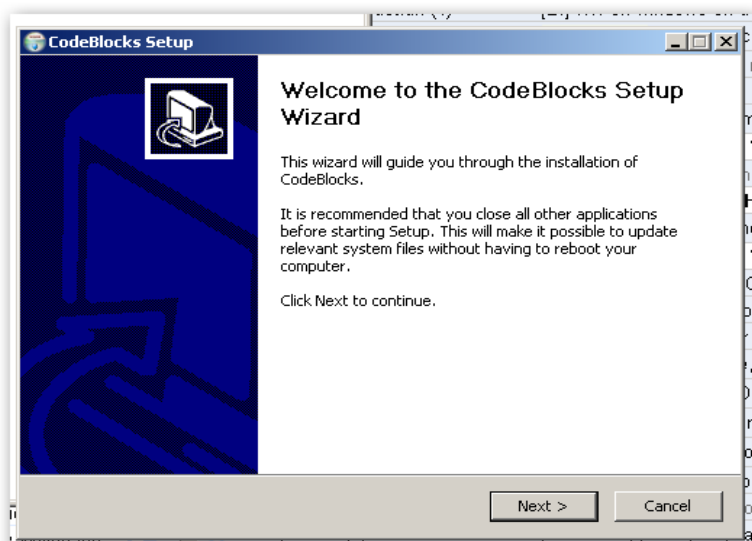

click the images to see big ones

- a) download code::blocks binary (latest release)

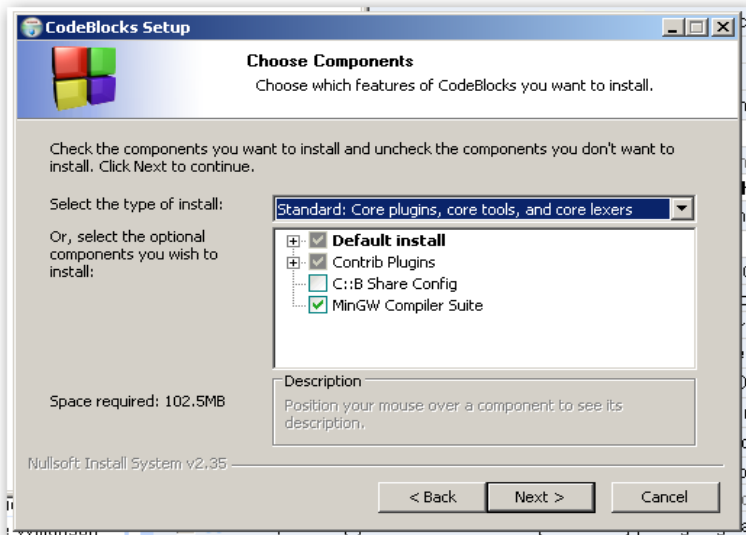

[Download Code::Blocks](#) note: download WITH mingw.

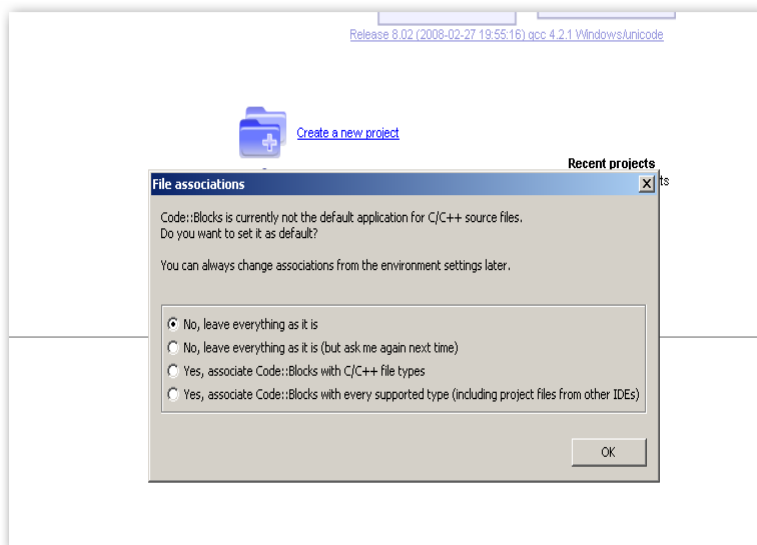

- b) install

you don't have to change anything

I chose not too, since code::blocks is not my primary IDE

e) add files to mingw

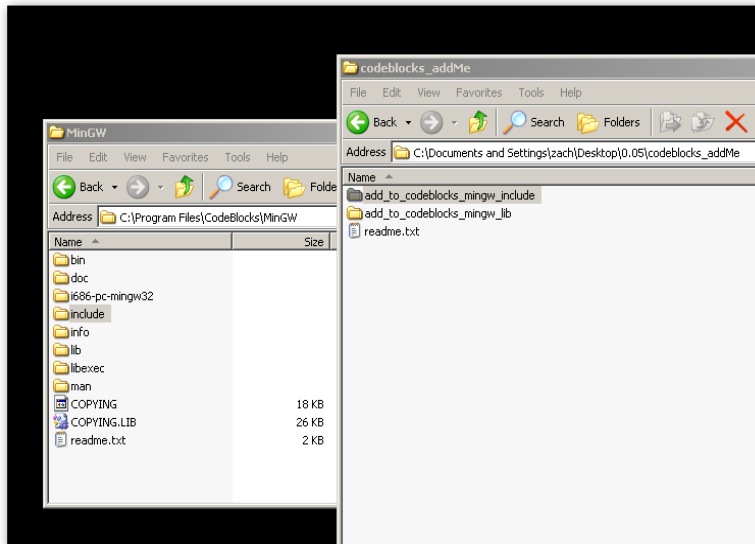

similar to devcpp, we will have to add a few libraries to devcpp. you can download the files : [here](#). in the zip there are two folders, you need to put the contents of them into the contents of folders in mingw.

-- add the contents of the folder

"add\_to\_codeblocks\_mingw\_include" into "C:\Program Files\CodeBlocks\MinGW\include" (or wherever your app\mingw\include is)

-- add the contents of the folder "add\_to\_codeblocks\_mingw\_lib"

into "C:\Program Files\CodeBlocks\MinGW\lib" (or wherever your app\mingw\lib is)

As always have fun!
